(57) ABSTRACT

Using a method of operating a system that includes remote servers, at least one electronic device, and multiple portable wireless devices, a user provides a verbal notification to the electronic device to place an outgoing call. The system uses the remote servers and other parts of the system to determine that one of the multiple portable wireless devices should be used for the outgoing call, and establishes a wireless connection between that portable wireless device and the electronic device. The system determines the particular portable wireless device to use by comparing the called entity with contacts associated with the multiple portable wireless devices, and selecting the portable wireless device with a contact that matches the called entity.
